

Principal Investigator

gated collaboration

GRBs Agent

Task input:

- the science question and the sample
- Stage-1 selections (detectors · background · source) — approved
- conventions, as quoted rulings
- ΔAIC tracking rule: >6 in 1–2 bins

gates

Agent actions:

1. read the law (skills · ledgers · contracts)
2. plan the roster; name unguarded debt
3. bin (Bayesian blocks) · fit 24 models/bin · mandated retry · hash-current promotion
4. temporal: 3 MVT primitives · pulse-scaled lag · windowed T90
5. render SEDs · montages · evolution — refusals labeled
6. verify: vision + numbers + seeds + ties (fresh contexts)
7. reconcile literature blind-first; attribute every mismatch
8. assemble the paper; conformance-gate it (R1–R5)

Human actions:

- read the live report (evidence-linked)
- APPROVE (identity-bound stamp) or FEED BACK — routed same session
- amend contracts in own words
- accept lessons; own the freeze
- a PI catch $\Rightarrow$ an agent was missing

live report

Final answer:

the gated per-burst paper + census rows, e.g.
break-preferring models TRACKED in 4/104 bursts;
two-break (DSBPL family) in 3/104 — strict: bn110928180
(literal margins 6.05/7.2 in its 2 tracked bins;
feature-level 24.0/9.2 there, 9–39 across its 4 bins);
thermal: per-burst candidates, e.g. $kT = 16.5 / 22.4 / 25.1$ keV;
the formally strongest ($kT=1.55$ keV) removed as an
edge artifact (3.92 kT gate)
— every number recomputed, every figure ledgered,
every absence reasoned
